The capacity index has the following meaning:

4: High capacity for all materials in this category. One pound takes up about 20% to 50% of its own weight average about 1/3 (33 1/35). This category includes most of the odor causing substances.

3: Satisfactory capacity for all items in this category these constitute good applications but the capacity is not as high as for category 4. Absorbs about 10% to 25% of its weight - average about 1/6 (16 7Z)

2: Includes substances which are not highly adsorbed but which might be taken up suffi-

ciently to give good service under the particular conditions of operation. These require individual checking.

1: Adsorption capacity is low for these materials Activated charcoal cannot be satisfactorily used to remove them under ordinary circumstances.

Some of the contaminants listed in the table are specific chemical co-pounds, some represent classes of co-pounds, and others are mixtures and of variable composition. Activated charcool's capacity for odors varies somewhat with the concentration in air, with humidity, and tem-

perature, and with the actual velocity used through the filters. The numbers given represent typical or average conditions and might vary in specific instances. The values in the table have been assembled from many sources including laboratory tests and field experience. This table should be used as a general rule only.

*Straight activated charcoal does not have much capacity for some reactive gases, such as ammonia, formaldehyde, etc. In some cases where the gas is chemically reactive, appropriate impregnated activated charcoal can be recommended.

Acetaldehyde
Acetic Acid
Acetic Anhydride
Acetone
Acrylic Acid
Acrylonitrile
Adhesives
Air-Wick
Alcoholic Beverages
*Amines
*Ammonia
Amyl acetate
Amyl alcohol
Amyl ether
