

Industrial Strength HEPA Filtration Systems for Temporary Cleanups

Amaircare employs a 3 stage filtration process that ensures you breathe the cleanest air possible.

1st Stage: Pre-filter

(clean every 3 to 6 months)
Removes larger particles from the air before they enter the HEPA filter. The pre-filter helps preserve and lengthen the life of the HEPA filter.

2nd Stage: HEPA

(replace every 3 to 5 years)
The HEPA filter is the heart of the system. It's able to capture the smallest microscopic particles from the air. The Amaircare HEPA uses our unique Perfect Seal™ technology that allows Amaircare to Exceed the HEPA standard of 99.97% efficient @ 0.3 microns.

3rd Stage: Inner Carbon Blanket (replace every 6 months) or **Carbon Canister** (replace every year)

Carbon is used to capture dangerous chemicals and odors from the air. Carbon acts as a sponge by absorbing chemicals & odors from the air.

Cleaning the Air

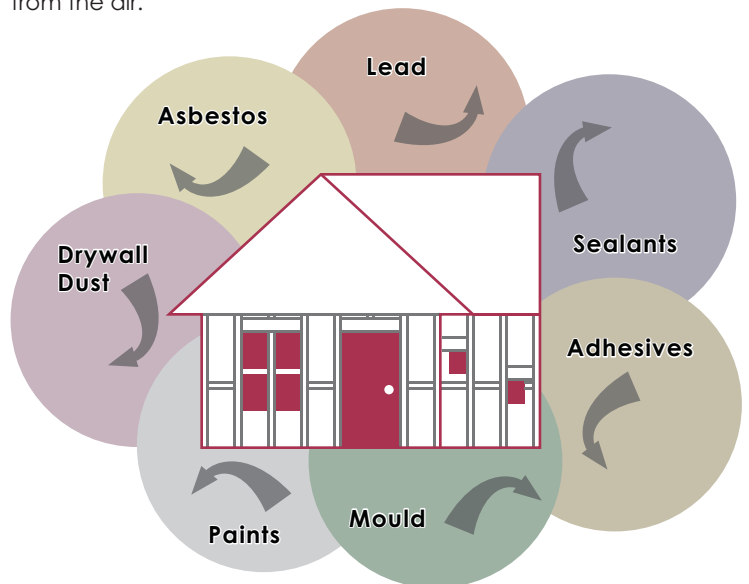

PARTICULATES – Works great for drywall dust, lead, asbestos, and other dangerous particles.

BIOBURDEN – Removes mould spores, bacteria, viruses

V.O.C.'s (VOLATILE ORGANIC COMPOUNDS) – Removes V.O.C.'s emitted from building products such as paint, glues, countertops, formaldehyde

Quality HEPA Filtration

Amaircare HEPA filters are all warrantied for 5 years. Also, Amaircare uses Perfect Seal Technology so each filter meets or exceeds HEPA standards.
